On April 18, 2014, PHMSA issued a Memorandum, REF: 13-0216 that addressed minimum thickness of various specification cargo tanks. (see attached file). This memo appears to no longer be available as a PHMSA interpretation (interp) when a search is made on PHMSA's website.

This interp amongst other things answers questions on when a MC331 cargo tank is below the minimum thickness. This interp tells us based on ASME code that the USDOT will allow .014" below the minimum thickness as shown on the specification plate. So, if a tanks minimum thickness as shown on the specification plate is .250", this tank would not be too thin until it is more then .014" below .250" or once the tank went below .236" for thickness.

PHMSA determined the .014" in the April 18, 2014, memo by using the ASME code for mill under tolerance for .01". The .004" is based on a ASME interpretation for rounding rules for a combination total of .014". (see attached file)

Below are the 49 CFR regulations for determining minimum thickness of specification cargo tanks.

Questions:

1. Is the April 18, 2014, Memorandum, REF: 13-0216 that addressed minimum thickness of various specification cargo tanks still accurate for when a MC 331 cargo tank is too thin and allowing .014" below the minimum thickness as shown on the specification plate before the tank is too thin.

2. If as described in question #1 is no longer allowed by the USDOT for a MC331 cargo tank when would a MC331 cargo tank that has a minimum thickness of .250" be below the minimum thickness?

If you have any questions, please let me know.

Thank you.

## § 180.407 Requirements for test and inspection of specification cargo tanks.

(i) Thickness testing.

(5) Minimum thicknesses for MC 300, MC 301, MC 302, MC 303, MC 304, MC 305, MC 306, MC 307, MC 310, MC 311, and MC 312 cargo tanks are determined based on the definition of minimum thickness found in § 178.320(a) of this subchapter. The following Tables I and II identify the "In-Service Minimum Thickness" values to be used to determine the minimum thickness for the referenced cargo tanks. The column headed "Minimum Manufactured Thickness" indicates the minimum values required for new construction of DOT 400 series cargo tanks, found in Tables I and II of §§ 178.346-2, 178.347-2, and 178.348-2 of this subchapter. In-Service Minimum Thicknesses for MC 300, MC 301, MC 302,

MC 303, MC 304, MC 305, MC 306, MC 307, MC 310, MC 311, and MC 312 cargo tanks are based on 90 percent of the manufactured thickness specified in the DOT specification, rounded to three places.

## § 178.320 General requirements applicable to all DOT specification cargo tank motor vehicles.

*Minimum thickness* means the minimum required shell and head (and baffle and bulkhead when used as tank reinforcement) thickness needed to meet the specification. The minimum thickness is the *greatest* of the following values:

(1)

(i) For MC 330, MC 331, and MC 338 cargo tanks, the specified minimum thickness found the applicable specification(s); or

(ii) For DOT 406, DOT 407 and DOT 412 cargo tanks, the specified minimum thickness found in Tables I and II of the applicable specification(s); or

(iii) For MC 300, MC 301, MC 302, MC 303, MC 304, MC 305, MC 306, MC 307, MC 310, MC 311, and MC 312 cargo tanks, the in-service minimum thickness prescribed in Tables I and II of <u>§ 180.407(i)(5) of this subchapter</u>, for the minimum thickness specified by Tables I and II of the applicable specification(s); or

(2) The thickness necessary to meet with the structural integrity and accident damage requirements of the applicable specification(s); or

(3) The thickness as computed per the ASME Code requirements (if applicable).
