NOV 18 2010

Mr. Michael H. Kyle
B. Knight Natural Gas Services
P.O. Box 5702
Midlothian, VA 23112

Dear Mr. Kyle:

In a letter to the Pipeline and Hazardous Materials Safety Administration (PHMSA) dated December 14, 2009, you requested an interpretation or opinion as to whether two specific installations of gas utilization equipment would meet the intent and requirements of 49 CFR § 192.197.

You provided two actual installations. In Installation 1, the value of outlet pressure could exceed 1 psig or 28-in water column (wc), and in Installation 2, the value of outlet pressure could approach 1psig (26-in wc). You stated your assumption is that the maximum operating inlet pressure allowed for most residential installations is limited to $\frac{1}{2}$ psi (14-in wc) and that pressures in excess of 1 psi (28-in wc) are likely to cause damage to the appliance regulator.

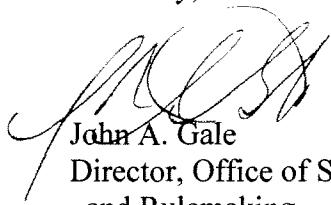

First, you asked whether the bolded words in the following two subsections of § 192.197 have the same meaning: in § 192.197(a)(5), “*... to prevent a pressure that would cause unsafe operation of any connected and properly adjusted gas utilization equipment*” and in § 192.197(c)(3),“*... set to open so that the pressure of gas going to the customer does not exceed a maximum safe value.*” The answer is that they do not have the exact same meaning. The phrase “*unsafe operation*” in § 192.197(a)(5) addresses both upper and lower pressure limits and means that the connection should regulate pressure so that it is neither so high as to create excessively high pilot light flames nor so low that the pilot light could extinguish and create the possibility of gas accumulation. The phrase “*exceed a maximum safe value*” in § 192.197(c)(3) addresses only the upper limit or high pressure.

Second, you asked what inlet pressure does § 192.197(a)(5) or § 192.197(c)(3) refer to? Regarding the limit for inlet pressure, § 192.197 is a design requirement under Subpart D-Design of Pipeline Components. The design requirements under Subpart D apply to the design of pipeline system or components to operate under conditions that are known or reasonably foreseeable at the time of installation. Therefore, § 192.197 does not prescribe a specific value as long as the inlet pressure does not cause damage to the appliance’s regulator.

Finally, you asked whether your recommendations in both installations are valid and meet the intent of § 192.197. Again, § 192.197 does not specify a specific value as long as the inlet pressure does not lead to unsafe conditions or cause damage to the gas utilization equipment or associated regulators.

I hope that this information is helpful to you. If I can be of further assistance, please contact me at 202-366-4046.

Sincerely,

John A. Gale
Director, Office of Standards
and Rulemaking

Dear Mr. Wiese,

We would like to get an interpretation or an opinion as to whether two specific installations would meet the intent and requirement of Title 49, Part 192.197. We would also like to get your opinion about the meaning of two passages in this section.

In 192.197 (a)(5) where it states, "to prevent a pressure that would cause unsafe operation of any connected and properly adjusted gas utilization equipment." and in 192.197(c)(3) where it states, "set to open so that the pressure of gas going to the customer does not exceed a maximum safe value," does the wording essentially have the same meaning or does each passage refer to some other different value? In other words, is the point where unsafe operation and exceeding the maximum safe value, the same value? If we assume that this would be at a point at where damage could occur to any appliance regulator, would that be a correct assumption?

In the following two installations, we will provide the actual as found conditions including type of equipment. The only assumption we have made is that the type and typical characteristics of the appliance regulators meets the same requirements as for a Maxitrol appliance regulator. Some proprietary controls with built in regulators may have higher or lower maximum pressure restrictions. To arrive at realistic values of load for each installation, we used the load factors as provided by NFPA 54 (ANSI Z223.1) which approximates the actual conditions in type and size.

In accordance with Maxitrol Bulletin MI2010-6/05, all of the rated regulators have an IAS Rated inlet pressure as established by ANSI standard Z21.18, of $\frac{1}{2}$ psi (14 in. w.c.). However, a minority of the appliance regulators are rated by Maxitrol at a maximum of 1 psi (28 in. w.c.) and one at a maximum of 5 psi (140 in. w.c.). Generally, none of these higher rated regulators would have the characteristics of regulators used with residential gas fired equipment however. It is also

Michael H. Kyle

B. Knight Natural Gas Services
P.O. Box 5702
Midlothian, Virginia 23112
Phone: (804) 744-1092
Cellular: (804) 928-5167
Fax: (804) 744-2774

stated that, The maximum Operating Inlet Pressures are tested in excess of these standards, and recommended by us. For this class of appliance regulators, this value of Maximum Operating Inlet Pressure (MOIP) is the same value as the IAS rating. Maxitrol also states in paragraph 5 of the bulletin that, "Very high pressure surges in the gas supply line (or as a result of exposing the system to high pressure) may result in serious internal damage and cause leakage or affect regulator operation. If you suspect that a Maxitrol regulator has been exposed to more than twice the maximum operating inlet pressure, as shown in the following chart, turn off the gas and have the system checked by an expert." The chart simply refers to the values as stated earlier.

We assume from that statement by Maxitrol and referring to their table in their bulletin, that the maximum operating inlet pressure allowed for most residential installations is limited to $\frac{1}{2}$ psi (14 in. w.c.) and that pressures in excess of 1 psi (28 in. w.c.) are likely to cause damage to the appliance regulator. The question then becomes, at what value does 192.197 (a)(5) or 192.197(c)(3) refer to? Would it be anything above $\frac{1}{2}$ psi (14 in. w.c), 1 psi, or some other value.

The following information is drawn from actual installations:

Installation 1- Single Service Regulator

Premise Type: Single apartment

Maximum Load: 160,000 Btu/Hr. or 160 cu. ft./Hr.

Inlet pressure to service regulator: 92 to 98 psig (Supplier's stated average is 94 psig)

Outlet pressure set-point of service regulator: 7" w.c., or 0.25 psig (standard pressure)
Service Regulator Data

Manufacturer: American

Type: 1213B

Connection Size: 1" x 1"

Orifice: 1/8"

Nominal Capacity: @5 psig inlet = 200 SCFH
 @60 psig inlet = 800 SCFH
 @100 psig inlet = 1400 SCFH

Approximate Relief Valve Performance: (Note: data provided represents outlet pressure relative to inlet in worst case condition) @5 psig inlet = 19 in. w.c.

 @60 psig inlet = 27 in. w.c.
 @ 100 psig inlet = 31 in. w.c.

Data Source: American Meter Bulletin, SB-8506.4

Midlothian, Virginia 23112
Phone: (804) 744-1092
Cellular: (804) 928-5167
Fax: (804) 744-2774

Installation 2- Single Service Regulator

Premise Type: Single apartment

Maximum Load: 160,000 Btu/Hr. or 160 cu. ft./Hr.

Inlet pressure to service regulator: 92 to 98 psig (Supplier's stated average is 94 psig)

Outlet pressure set-point of service regulator: 7" w.c., or 0.25 psig (standard pressure)

Service Regulator Data

Manufacturer: Equimeter

Type: 143-1

Connection Size: 1" x 1"

Orifice: 1/8"

Nominal Capacity: @5 psig inlet = 250 SCFH
 @60 psig inlet = 1200 SCFH
 @80 psig inlet = 1540 SCFH

Approximate Relief Valve Performance: (Note: data provided represents outlet pressure relative to inlet in worst case condition) @5 psig inlet = 19 in. w.c.

 @60 psig inlet = 20 in. w.c.

 @ 80 psig inlet = 22 in. w.c.

 @100 psig inlet = 27 in. w.c.

Data Source: Sensus Metering Systems, TD-1301

The approximate relief valve performance is based the work case condition for a new regulator and does not take in to account any blockage of the relieve opening over time nor other conditions which might preclude degradation of the relief valve performance.

Installation 1 clearly shows that under worst case conditions, the value of outlet pressure could exceed 28 in. w.c. which is above the maximum safe value as stated by Maxitrol. In Installation 2, the value of outlet pressure under worst case conditions could approach 26 in. w.c which would be below the maximum safe value as stated by Maxitrol but well above the MOIP.

In your opinion, do these installations meet the requirements or intent of the regulations?

Our recommendations in both installations, since they already had the smallest orifice available, were to install an appropriate field cut regulator with integral relief valve ahead of the service regulator in order to reduce the inlet pressure to as low a value of inlet pressure to the service

regulator as possible and still have the required capacity. Our train of thought on this was to insure as great a degree of safety as possible and stay within industry practices.

In your opinion, would this be a valid recommendation?

We certainly appreciate the time and effort on your part and that of your staff in answering our questions.

Sincerely,

B. Knight Natural Gas Services

Michael H. Kyle

1213B2 Service Regulators

General Information

The American Meter Series 1213B2 pressure regulator is designed for natural gas applications and features a compact, lightweight design for fast, easy installation. Interchangeable orifices and springs provide a wide range of outlet pressures and flow rates. Outlet pressures between 3.5" W.C. and 5 PSIG are available. Operating temperature range is -20° F to 150° F (-30° C to 65° C). Maximum flow rate is 2500 SCFH (70.8 m³/h).

The diaphragm case may be easily removed for routine inspection without disturbing the line connections. All models conform to ANSI Code B109.4-1998, and CGA Service-type Regulator Specification CAN/CGA-6.18-M95.

Exclusive, 7 - Step Corrosion Protection

The protective finish on the 1213B2 regulator resists corrosive effects of weather and harsh environments better than any other in the industry. Each precision die cast aluminum regulator is treated-inside and out-with a special conversion coating that's part of an exclusive, 7-step finishing process. This coating greatly inhibits oxidation of the metal's surface that can eventually compromise the integrity of the metal. It also prevents finish paint from cracking and blistering. A single coat polyester primer and the high solid polyurethane top coat provides a long-lasting protection to all exterior regulator surfaces. The American Meter conversion coating process meets all environmental protection regulations.

High Tensile Strength Valve Bodies

Each 1213B2 regulator is equipped with a high tensile strength cast iron valve body that rotates in 90-degree increments and features extra heavy wall thickness. This provides maximum strength to withstand installation stresses without damage and prevents thread galling experienced with aluminum.

1213B2 regulator valve bodies are treated with a 5-step metal finishing process. The treated metal is painted with a single coat polyester paint.

Available valve body sizes are: 3/4" x 3/4", 3/4" x 1" and 1" x 1" NPT or BSP-TR for 180° valve bodies. Also available is a 90° valve body in 3/4" x 3/4", 3/4" x 1", 1" x 1" and 1/2" x 1" NPT and 3/4" x 3/4" BSP-TR.

Features

In response to a market survey, the following features were designed into the 1213B2 regulator to accommodate the customers needs.

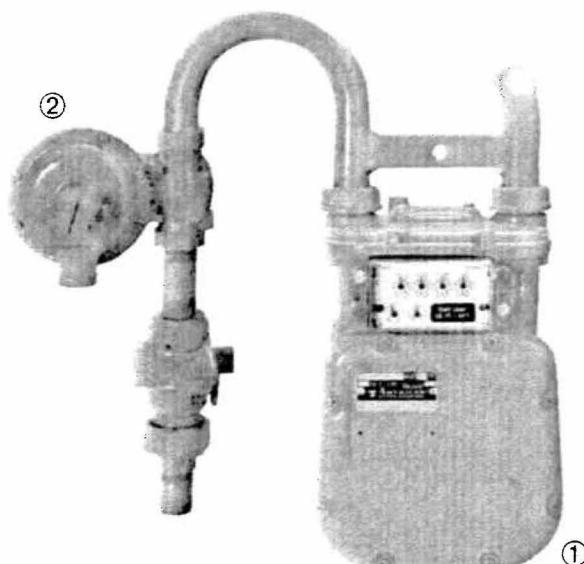

- Improved relief performance.
- Improved performance repeatability.
- Lever design provides for secondary emergency relief in the event of unauthorized removal of the seal plug.
- Snap-in internal components (quick change outs).
- Non-adjustable relief.
- Larger seat disc area.
- 1213B and 1213B2 use the same seal plug to avoid loss of emergency relief should the seal plugs be interchanged.

Application

The 1213B2 features a full capacity internal relief valve with large passages to assure the fast release of gas (See performance graphs on page 5). For added protection, a secondary relief valve stop is provided to assure operation under the most severe conditions and in the event the seal plug has been removed. The standard relief spring setting is 8.0" W.C. above the normal 7" W.C. outlet pressure.

Valve body configuration permits the 1213B2 regulator to be supplied in four positions as specified on page 7. All 1213B2 regulators are available with either right angle (90-degree) or straight flow (180-degree) valve bodies. Vents can also be supplied in four different positions.

The 1213B2 regulator is designed with an extra large, removable weather and bug-proof stainless steel screened vent to resist freeze-ups and to exclude foreign matter. The vent is threaded 3/4 inch NPT making it suitable for indoor installations.

① AC250 Aluminumcase Meter; ② 1213B2 Regulator;

1213B2 Service Regulators

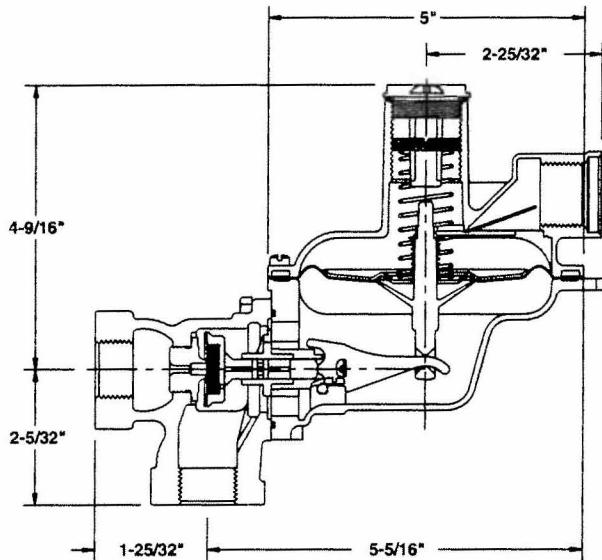

Options

Meter Bar- The 1213B2 regulator can be used with a detachable meter bar 3/4" x 3/4" (Part number 72476G001), 3/4" x 1" (Part number 72476G003) and 1" x 1" (Part number 72476G004) for compact and convenient installation to meters with 6" connection centers. Use of a meter bar prevents piping stress from being transferred to the gas meter.

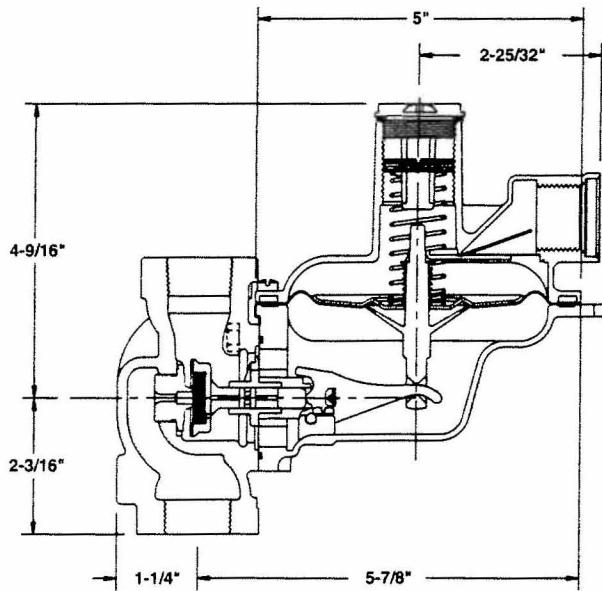

Vent Elbow- The regulator vent opening should face downward (6 o'clock) to minimize the chance of blockage from ice and snow. If not, a 3/4" NPT plastic, 90° vent elbow (Part number 78041P025) and separate protective screen (Part number 70400P017) may be screwed into the vent to provide the necessary protection.

Elevation Compensation- E.C. orifices are also available, which provide constant outlet pressure even when inlet pressure fluctuates greatly. The elevation compensation orifice is a device which reduces changes in regulator outlet pressure due to change in inlet pressure.

The E.C. orifice is recommended for installations where the inlet pressure may vary over a wide range. The E.C. orifice is available in two sizes: 1/8" x 3/16" (Part number 73698G006) and 3/16"(Part number 73698G005). Its capacity is the same as a standard orifice of the same size. Consult your American Meter Sales Representative for specific applications.

3/16"	72494P042
1/8"	72494P040

Full Open Regulator Relief Capacity

For sizing downstream relief valves, use the following formulas to determine the regulator full open capacity:

For critical flow rates For sub-critical flows

$$Q = 0.5 C \times \frac{P_1}{\sqrt{G}}$$

$$Q = C \frac{\sqrt{P_2 h}}{\sqrt{G}}$$

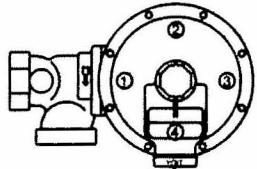

Key:

- Q = Maximum capacity of regulator
- C = Orifice constant, see table
- P₁ = Inlet absolute pressure (PSIA)
- P₂ = Outlet absolute pressure (PSIA)
- h = Differential pressure (P₁ - P₂)
- G = Specific gravity of gas

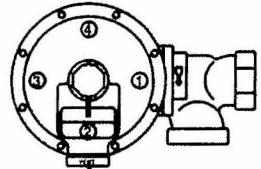

Orifice	C
1/8"	20
3/16"	46
1/4"	80
5/16"	150

Minimum _____ PSIG

Shipping Weight -

28 lbs/carton of eight regulators

Regulator Pressure Rating

125 PSIG = Maximum recommended inlet pressure for normal service. Maximum recommended pressure may vary with orifice size.

175 PSIG = Maximum inlet pressure for abnormal or emergency service, without causing damage to regulator case.

5 PSIG = Maximum outlet pressure for normal service.

10 PSIG = Maximum outlet pressure which can be contained by pressure carrying components (no flange leakage to atmosphere except for normal relief action). **If regulator is subjected to these conditions, it should be removed from service.**

50 PSIG = Maximum outlet pressure for abnormal service without damage to internal components. **If regulator is subjected to these conditions, it should be removed from service.**

Due to continuous development the information in this document is subject to change.

Valve Body: Cast Iron, 125 psig Working Pressure	Straight Body
Spring and Lower Case: Die-Cast Aluminum	3/4" x 3/4"
Orifice: Stainless Steel	3/4" x 1"
Fulcrum Pin: Aluminum or Brass	3/4" x 1-1/4"
Valve Seat/Stem: One piece molded Buna-N seat pad and fiberglass reinforced nylon stem	1" x 1"
Throat/Support/Stem Guide: Cast Aluminum integral to lower case	1" x 1-1/4"
Diaphragm Plate: Plated Steel	1-1/4" x 1-1/4"

Diaphragm: Nylon fabric reinforced Buna-N with full 26 in² effective area

Vent and Valve: Precision-fit polyethylene valve and seat, threaded 3/4" or 1" NPT

Operating Temperature: -20° F to 150° F (-28.9° C to 65.5° C)

Corrosion Protection: Cases dip primed chromate conversion coating, topcoat enamel

Internal Relief Valve: Set to relieve at approximately 7" w.c. above normal outlet pressure setting

Spring Ranges

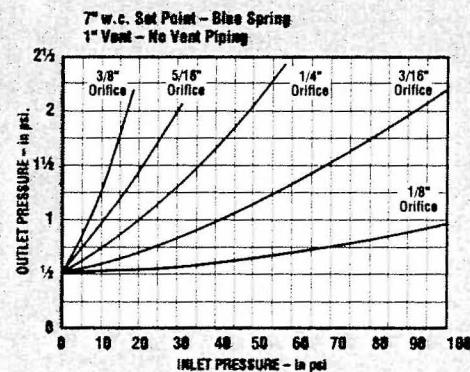

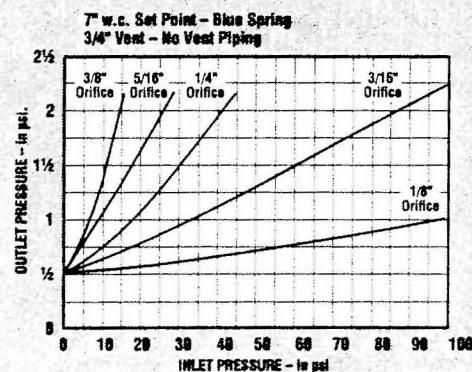

Outlet Pressure Ranges	Spring Color	Spring Part Number
3 1/2" to 6 1/2" w.c.	Red	143-62-021-15
5" to 8 1/2" w.c.	Blue	143-62-021-16
6" to 14" w.c.	Green	143-62-021-17
12" to 28" w.c.	Orange	143-62-021-18
1/2 psi to 2 psi	Black & White	143-62-021-22
1/2 psi to 3 psi	Cadmium*	173-62-021-02
2 to 6 psi	Black*	139-16-021-01

*For high pressure model 143-80-2HP

Orifice and Maximum Inlet Pressure

Orifice	Part Number	Pressure
1/8" aluminum	143-62-023-37	125 psig
3/16" aluminum	143-63-023-40	125 psig
1/4" aluminum	143-62-023-42	60 psig
5/16" aluminum	143-62-023-43	40 psig
3/8" aluminum	143-62-023-44	40 psig
1/2" aluminum	143-62-023-45	20 psig
5/8" aluminum	143-62-023-46	10 psig

Relief Valve Performance: Lever blocked with valve disc in the wide open position

Maximum Emergency Pressure

The maximum pressure that the model 143-80-1, 143-80-2 and 143-80-2HP regulator inlets may be subjected under abnormal conditions without causing damage to the regulator is the stated Maximum Inlet Pressure + 50 psi

Note: For the Low Pressure Cut Off version model 143-80-6 it is Maximum Inlet Pressure + 10 psi. See bulletin TD-1301-L

The maximum pressure to which the 143-80 diaphragm case may be subjected under abnormal conditions without causing damage to the internal parts of the regulator is the set point + 3 psi.

If the outlet pressure exceeds this pressure, the regulator must be removed from service and carefully inspected. Damaged or otherwise unsatisfactory parts must be replaced before returning the regulator to service. The maximum outlet pressure that can be safely contained in the 143-80 diaphragm case is 10 psi (safely means no leakage as well as no bursting).

Full Open Capacity

Use the following formula for the full open capacity:

$$1. Q = K \sqrt{P_0(P_1 - P_0)} \quad \text{(for } \frac{P_1}{P_0} \text{ less than 1.894)}$$

$$2. Q = \frac{KP_1}{2} \quad \text{(for } \frac{P_1}{P_0} \text{ greater than 1.894)}$$

Q = maximum capacity of the regulator
(in SCFH of 0.6 specific gravity natural gas).

K = the "K" factor, the regulator constant from the table below.

P = absolute inlet pressure (psia).

P₀ = absolute outlet pressure (psia).

Orifice	5/8"	1/2"	3/8"	5/16"	1/4"	3/16"	1/8"
K	820	520	292	206	132	74	33

Model 143-80

Technical Data

Capacities

Flow capacities in SCFH natural gas
(0.6 specific gravity – 14.65 psia – 60°F)
Capacities are based on the following maximum variations in outlet pressure:

- Red and Blue Springs – 1" w.c. droop
- Orange Spring – 3" w.c. droop
- Green Spring – 2" w.c. droop
- Black Spring – 10% droop

Note: The 1/2 psig, 1 psig and 2 psig inlet pressures apply only to Red and Blue springs.

Note: The last capacity figure in each column indicates the maximum capacity for each orifice at recommended pressure within the optimum performance range.

The performance data is based on normal testing at 70°F flowing temperature.

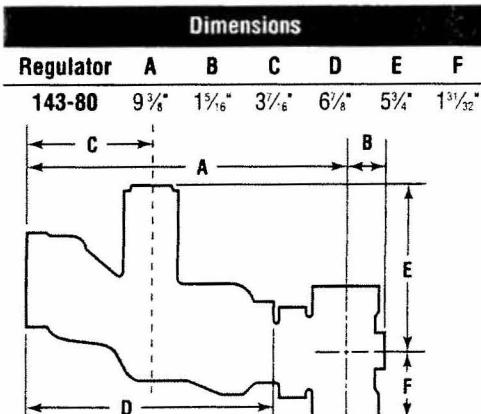

Changes in performance can occur at extreme low flowing temperatures.

Other Gases

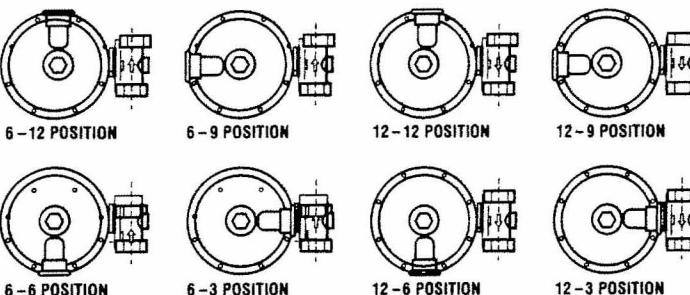

143-80 Regulators are mainly used on natural gas. However, they perform equally well on LP gas, nitrogen, dry CO₂, air and others.

Other Gases	Correction Factor
Air (Specific Gravity 1.0)	0.77
Propane (Specific Gravity 1.53)	0.63
1350 BTU Propane Air Mix (1.20)	0.71
Nitrogen (Specific Gravity 0.97)	0.79
Dry Carbon Dioxide (Specific Gravity 1.52)	0.63

For other non corrosive gases: $\sqrt{\frac{0.6}{\text{Specific Gravity of the Gas}}}$
CORRECTION FACTOR =

SAFETY WARNING INSTRUCTIONS

MAXITROL CSA DESIGN CERTIFIED
GAS PRESSURE REGULATORS

**NOTE: GAS PRESSURE REGULATORS WILL NOT
TURN OFF THE FLOW OF GAS.**

**SPECIAL WARNINGS**

IF YOU DO NOT FOLLOW THESE INSTRUCTIONS EXACTLY,
A FIRE OR EXPLOSION MAY RESULT CAUSING PROPERTY
DAMAGE, PERSONAL INJURY OR LOSS OF LIFE.
NO UNTRAINED PERSON SHOULD ATTEMPT TO INSTALL,
MAINTAIN OR SERVICE GAS PRESSURE REGULATORS.

To minimize the possibility of FIRE, EXPLOSION, and OTHER HAZARDS:

1. All products, including gas pressure regulators, used with combustible gas **must** be installed and used **strictly** in accordance with the instructions of the manufacturer, with government codes and regulations, and plumbing codes and practices.
2. **Do not** use a gas pressure regulator if it appears to have been subjected to high temperatures, damaged in any way, or to have been taken apart or tampered with. Any of these may be signs of possible leakage or other damage that may affect proper operation and cause potentially dangerous combustion problems
3.
 - a. Install the regulator properly with gas flowing as indicated by the arrow on the casting.
 - b. Use pipe compound or thread sealant, properly threaded pipes and careful assembly procedure so that there is no cross threading, etc., which might cause damage or leakage.
 - c. Apply wrench or vise pressure only to the flat areas around the pipe tappings at the end being threaded to the pipe to avoid possible fracture of the regulator body which could result in leakage
 - d. Make sure markings or wording on regulator are not painted over or obliterated.
4. Check carefully for gas leaks immediately after the regulator has been installed and the gas turned on. **Do this before attempting to operate the appliance or other gas burning device.** Use a rich soap solution (or other accepted leak tester) around the diaphragm flanges, bottom plate, vent opening, seal cap, pipe connections, and all other joints. Wipe clean with a damp rag. It is a good practice to periodically check for leakage during use of the appliance. **Absolutely no leakage should occur, otherwise there is a danger of fire or explosion depending upon conditions. Never use if leakage is detected.**

**CAUTION**

NEVER CONNECT REGULATOR DIRECTLY TO THE PROPANE SUPPLY SOURCE. MAXITROL REGULATORS REQUIRE AN EXTERNAL REGULATOR (NOT SUPPLIED).
INSTALL THE EXTERNAL REGULATOR BETWEEN THE PROPANE SUPPLY SOURCE AND MAXITROL REGULATOR.

5. Very high pressure surges in the gas supply line (or as a result of exposing the system to high pressure) may result in serious internal damage and cause leakage or affect regulator operation. If you suspect that a Maxitrol regulator has been exposed to more than twice the maximum operating inlet pressure, as shown in the following chart, turn off the gas and have the system checked by an expert.

DIRECTIVES DE SÉCURITÉ

RÉGULATEURS DE PRESSION DE GAZ MAXITROL
CERTIFIÉS CSA

REMARQUE: LES RÉGULATEURS DE PRESSION DE GAZ N'INTERROMPENT PAS L'ÉCOULEMENT DU GAZ.

**AVERTISSEMENTS PARTICULIERS**

LA NON-COFORMITÉ AUX DIRECTIVES QUI SUIVENT PEUT PROVOQUER UN INCENDIE OU UNE EXPLOSION QUI PEUT ENDOMMAGER LA PROPRIÉTÉ, OU ENCORE CAUSER DES BLESSURES OU ENTRAÎNER LA MORT.
AUCUNE PERSONNE NE POSSÉDANT PAS LA FORMATION REQUISE NE DEVRAIT TENTER D'INSTALLER, D'ENTREtenIR OU DE RÉPARER DES RÉGULATEURS DE PRESSION DE GAZ.

Pour réduire au minimum les risques d'INCENDIE, D'EXPLOSION, ET AUTRES RISQUES:

1. Tous les produits, y compris les régulateurs de pression de gaz, utilisés avec des gaz combustibles doivent être installés et employés en **strict** conformité avec les directives du fabricant, les codes et règlements gouvernementaux et les codes et pratiques en matière de plomberie.
2. Ne pas employer un régulateur de pression de gaz qui semble avoir été soumis à des températures élevées, endommagé de quelque façon que ce soit, avoir été démonté ou manipulé. Toutes ces situations indiquent des possibilités de fuite ou de tout autre dommage qui pourrait nuire au bon fonctionnement de l'appareil et provoquer des problèmes de combustion potentiellement dangereux.
3.
 - a. Installer le régulateur correctement de sorte que le gaz s'écoule dans le sens indiqué par la flèche gravée.
 - b. Utiliser un composé ou un mastic pour joints filetés, des tuyaux filetés soudés correctement, et suivre des méthodes d'assemblage adéquates de façon à éviter les filets faussés, etc., qui puissent provoquer des dommages ou des fuites.
 - c. Appliquer la pression d'une clé ou d'une pince-étai uniquement aux surfaces plates autour des raccords des tuyaux à l'embout vissé à la canalisation pour éviter de fracturer le corps du régulateur, ce qui pourrait provoquer des fuites.
 - d. S'assurer que les marques ou les mots qui apparaissent sur le régulateur ne sont pas recouverts de peinture ou cachés de quelque autre manière.
4. Vérifier soigneusement les fuites de gaz immédiatement après l'installation du régulateur et la reprise de l'alimentation en gaz. Procéder à la vérification avant de tenter de mettre l'appareil ou tout autre appareil au gaz en marche. Utiliser une solution savonneuse (ou une autre solution servant à repérer les fuites) autour des brides de la membrane et autour de la plaque du fond, de l'ouverture de purge, du bouchon d'étanchéité, des raccords des canalisations et des autres joints. Essuyer le tout au moyen d'un chiffon humide. On recommande de vérifier à l'occasion la présence de fuite pendant que l'appareil fonctionne. Il ne devrait y avoir absolument aucune fuite. Une fuite de gaz présente un danger d'incendie ou d'explosion selon la situation. Ne jamais utiliser l'appareil en cas de fuite.

**MISE EN GARDE**

NE JAMAIS RACCORDER DIRECTEMENT LE RÉGULATEUR À LA SOURCE D'ALIMENTATION EN PROPANE. LES RÉGULATEURS MAXITROL EXIGENT LA PRÉSENCE D'UN RÉGULATEUR EXTERNE (NON FOURNI). INSTALLER LE RÉGULATEUR EXTERNE ENTRE LA SOURCE D'ALIMENTATION EN PROPANE ET LE RÉGULATEUR MAXITROL.

5. Les surpressions très élevées dans la canalisation d'alimentation (ou découlant d'une exposition du système à des pressions élevées) peuvent provoquer d'importants dommages internes et causer des fuites ou nuire au fonctionnement du régulateur. Si l'on soupçonne qu'un régulateur Maxitrol a été exposé à plus du double de la pression d'entrée maximale, comme l'indique le tableau ci-dessous, couper l'arrivée de gaz et faire vérifier le système par un spécialiste.

MAXITROL **company®**

23555 Telegraph Rd. • P.O. Box 2230 • Southfield, MI U.S.A. 48037-2230

Phone 248.356.1400 • Fax 248.356.0829

6. Venting **must** be controlled in accordance with government and plumbing codes and regulations to avoid the danger of escaping gas should there be internal leakage. Vent pipes **must** be open and the open end protected against entry of foreign matter, including water.
7. The outlet pressure of the regulator **must** be measured to make sure it is in accordance with intended usage. If a spring change is required to develop the required outlet pressure, the spring **must be one specified by MAXITROL** and the new outlet pressure recorded on the regulator.
8. Caution should be used to guarantee that there is sufficient inlet pressure to achieve the desired outlet pressure and no readjustment of the outlet pressure setting should be made unless the inlet pressure is within the proper limits for the regulator. Failure to follow this may result in overfiring of the appliance or other gas burning device. **The MAXITROL bulletin for the regulator** should be consulted for specific inlet and outlet pressure relationships.
9. For convertible regulators, simply invert the snap-in device beneath the cap to convert from natural to LP.
10. A MAXITROL regulator **must be used** within the temperature range and not in excess of the maximum inlet pressure shown in the following table and should be in the mounting position indicated. Maxitrol regulators can be used with all fuel gases.
11. In case of any doubt, please contact the Service Manager, Maxitrol Company, Southfield, MI USA. Phone: 248/356-1400.
- PRESSURE RATING INFORMATION:** Inlet pressures shown below are for **IAS Rated Inlet Pressures** and **Maximum Operating Inlet Pressures**. The IAS Rated Inlet Pressures are established by ANSI standard Z21.18 and CAN1-6.3 (CV47 also certified to Z21.78 and CAN1-91). The Maximum Operating Inlet Pressures are tested by Maxitrol in excess of these standards, and recommended by us.
6. L'aération doit être réglée conformément aux règles gouvernementales et aux codes de plomberie afin d'éviter les dangers reliés aux fuites de gaz. Les canalisations d'aération doivent être ouvertes et l'extrémité ouverte doit être protégée contre la pénétration de matières étrangères, y compris l'eau.
7. On doit mesurer la pression de sortie du régulateur et s'assurer qu'elle convient à l'usage prévu. Si l'on doit changer le ressort afin d'obtenir la pression de sortie voulue, le ressort doit faire partie de ceux qui sont recommandés par Maxitrol et la nouvelle pression de sortie doit être inscrite sur le régulateur.
8. On doit prendre les mesures nécessaires pour garantir que la pression d'entrée suffit à obtenir la pression de sortie voulue. On ne doit apporter aucun ajustement de pression de sortie si la pression d'entrée dépasse les limites prescrites pour le régulateur. La non-conformité à cette consigne peut provoquer la surchauffe de l'appareil ou d'un autre dispositif au gaz. Consulter la notice sur le régulateur Maxitrol pour connaître les relations précises entre les pressions d'entrée et de sortie.
9. Dans le cas de régulateurs combinés, il suffit d'inverser le dispositif encliquetable situé sous le couvercle pour convertir le régulateur du gaz naturel au pétrole liquéfié.
10. On doit employer un régulateur Maxitrol dans les limites des températures indiquées et sans dépasser la pression d'entrée maximale figurant au tableau ci-dessous. Le régulateur devrait aussi être installé dans la position de montage indiquée. Les régulateurs Maxitrol peuvent être employés avec tous les types de gaz combustibles.
11. En cas de doute, communiquer avec le directeur du service après-vente de Maxitrol, à Southfield, au Michigan. Téléphone: (248) 356-1400.
- PRESSIONS NOMINALES:** Les pressions d'entrée indiquées ci-dessous correspondent aux **pressions d'entrée nominales IAS** et aux **pressions d'entrée maximales de fonctionnement**. Les pressions d'entrées nominales IAS sont établies d'après la norme ANSI Z21.18 et la norme CAN1-6.3 (le modèle CV47 est également certifié conforme aux normes Z21.78 et CAN1-9.1). Les pressions d'entrée maximales de fonctionnement ont été mises à l'essai par Maxitrol à des pressions qui dépassent celles qui sont spécifiées par les normes, et recommandées par nous.

Model Number (Numéro de modèle)	IAS Rated Inlet Pressure (Pression d'entrée nominale IAS)	Maximum Operating Inlet Pressure (Pression d'entrée maximale de fonctionnement)	Pressure Range [inches w.c.] (Plage de pression réglable) [en pouce d'eau]		Ambient Temperature Range (Plage de température ambiante)	Mounting Position [see below] (Position de montage) [voir ci-dessous]

* psi / 1129 mbar

NOTE: (*1) To ensure fast response of the regulator when equipped with a ball-check type automatic vent limiting device (12A04, 12A09, 12A39), regulators **must** be in upright position (A) with non-integral vent limiter installed directly into vent threads. **Any other mounting position may interfere with lockup or cause pilot outage, where applicable.** Maximum inlet pressure for regulators with 12A09 or 12A39 is 2 psi (LP) or 5 psi (natural). Inlet pressures exceeding 2 psi (LP) or 5 psi (natural) require a vent line.

(*2) Minimum vacuum pressure -0.3 to -13.0 inches w.c., added to set pressure.

(*3) Minimum vacuum pressure -0.3 to -11.5 inches w.c., added to set pressure

Remarque (*1): Pour garantir une réponse rapide du régulateur quand l'équipement comprend un dispositif automatique de limitation de ventilation du type à clapet de non-retour à boule (12A04, 12A09, 12A39), les régulateurs doivent être en position verticale (A) avec un limiteur de ventilation non solidaire installé directement dans les filets de l'évent. **Toute autre position de montage peut gêner le verrouillage ou causer une panne du pilote, là où c'est applicable.** Les régulateurs équipés de 12A09 ou de 12A39 sont limités à des pressions maximales d'admission de 2 psi (LP) ou 5 psi (naturel). Pour toutes applications nécessitant de pressions d'admission supérieures à 2 psi (LP) ou 5 psi (naturel) un tuyau d'aération est requis.

(*2) Pression à vide minimale de -0,3 à -13,0 pouces d'eau ajoutée à la pression réglée.

(*3) Pression à vide minimale de -0,3 à -11,5 pouces d'eau ajoutée à la pression réglée.
